

Template Syntax

Template Syntax

Template Syntax

- Syntax to control the view / template
- Connect the view to the behaviour
- Compiled by Angular

Template Syntax

- `{{ interpolation }}`
- `| pipes`
- `* structural directives`
- `# template reference variable`
- `attribute directives`
- `[property]` and `(event)` binding

Situation

To Do

Show a list of books

☐ UNASSIGNED

Give reserved books a different colour

☐ UNASSIGNED

The books can be selected

☐ UNASSIGNED

Show the title, author and price

☐ UNASSIGNED

Show the price as currency

☐ UNASSIGNED

Show the cover of the book

☐ UNASSIGNED

(event) binding

Event binding connects user actions to the code

```
<ul>
  <li
    *ngFor="let book of books">
    <button [ngClass]="{'bg-carrot':
                        book.reserved}"
            (click)="onSelect(book)">
      {{ book.title }} -
      {{ book.price | currency: 'EUR' }}
    </button>
  </li>
</ul>
```

[property] binding

Evaluate the expression and set the right property

```
<ul>
  <li
    *ngFor="let book of books">
    <button [ngClass]="{'bg-carrot':
                        book.reserved}"
            (click)="onSelect(book)">
      <img [src]="book.img"
          [attr.aria-label]="book.title"/>
    </button>
  </li>
</ul>
```

*ngIf

Show an element conditionally

```
<div *ngIf="ready">
```

```
  content
```

```
</div>
```

***ngIf; else**

is a Template reference variable

```
<div *ngIf="ready; else notReady">
```

```
  content
```

```
</div>
```

```
<ng-template #notReady> content </ng-template>
```

*ngFor revisited

Get the index

```
<li *ngFor="let book of books; index as i">  
  {{ i }}. {{ book.name }}  
</li>
```

Also:

- first, last, even, odd

CommonModule

CommonModule provides Angular pipes & directives

```
@NgModule({  
  imports: [ CommonModule ]  
})
```

CommonModule @Directives

- `*ngFor`
- `*ngIf`
- `ngSwitch`
- `ngClass`
- ...

CommonModule @Pipes

- | uppercase, lowercase, titlecase
- | date
- | currency
- | json
- | keyvalue

Recap Template Syntax

- CommonModule
- {{ interpolation }}
- | pipe
- *ngFor, *ngIf
- # template reference variable
- [property binding]
- (event binding)

Component communication

Component communication

- Tree structure
- Parent / Child relation
- They are connected through the template

AppComponent

```
<h2> Hello Angular </h2>
<div>
  <ibs-contacts
    [contacts]="contacts"
    (select)="select($event)">
  </ibs-contacts>
</div>
```

contacts

@Input()
contacts: Contact[]

data

@Output()
select: EventEmitter

Costs

- Architecture setup
- Feels over-engineered
- Different ways

Benefits

- **Testability**
- **Easier mental model**
- **Flexibility for change**
- **Uniformity**

Code
